WET OP VOEDINGSMIDDELS, SKOONHEIDSMIDDELS EN ONTSMETTINGSMIDDELS, 1972 (WET 54 VAN 1972), EN WET OP GESONDHEID, 1977 (WET 63 VAN 1977).—REGULASIES BETREFFENDE BESTRALING EN VERKOOP VAN BESTRAALDE VOEDINGSMIDDELS EN SKOONHEIDSMIDDELS—VERBETERING VAN KENNISGEWING

Onderstaande verbetering van Goewermentskennisgewing 2572 van 15 November 1985 word hierby gepubliseer:

Voeg die volgende Aanhangesel by die regulasies:

“AANHANGSEL

Dosismeting

1. Die algemene gemiddelde geabsorbeerde dosis.

By die bepaling van die heilsaamheid van voedingsmiddels wat behandeld is met 'n algemene gemiddelde dosis van 10 kGy of minder, kan aanvaar word dat al die chemiese effekte van straling binne die bepaalde dosisreeks in verhouding tot die dosis is.

Die algemene gemiddelde dosis, D, word gedefinieer deur die volgende integraal oor die totale volume van die goedere:

$$\bar{D} + \frac{1}{M} \int p(x, y, z) \cdot d(x, y, z) \cdot dV$$

waar

M = die totale massa van die behandelde monster

p = die plaaslike digtheid by die punt (x, y, z)

d = die plaaslike geabsorbeerde dosis by die punt (x, y, z)

dv = dx dy dz, die infinitesimale volume-element wat in werklike gevalle verteenwoordig word deur die volumefrakties.

- (b) with effect from 1 December 1985, specify the illnesses and circumstances mentioned below as illnesses in respect of which and the circumstances under which, an illness benefit may be paid under subsection (1) (a) of the said section.

Specified illnesses and circumstances

Any medically recognisable disease-entity or symptom-complex which arises in circumstances beyond the control of the individual and in respect of which the person concerned requires medical treatment in the interests of his well-being: Provided that conditions such as alcoholism, anxiety, debility, depression, drug dependence, insomnia or neurasthenia shall not be regarded as recognisable disease-entities or symptom-complexes, except—

- (a) in the case of vague diagnoses such as anxiety, depression or insomnia, which shall be regarded as recognisable only for the duration of the period for which a person is admitted to a recognised hospital for treatment, *or receives out-patient treatment or treatment at the consulting-rooms of a private medical practitioner* in respect of which a medical clinical report is furnished by a medical practitioner from which it appears clearly that the person duly suffers or suffered from a disease; and
- (b) in the case of alcoholism or drug dependence, which shall be regarded as recognisable only for the duration of the period for which a person is admitted to and undergoes treatment for alcoholism or drug dependence at a recognised registered rehabilitation centre or State psychiatric hospital.

FOODSTUFFS, COSMETICS AND DISINFECTANTS ACT, 1972 (ACT 54 OF 1972), AND HEALTH ACT, 1977 (ACT 63 OF 1977).—REGULATIONS GOVERNING IRRADIATION AND SALE OF IRRADIATED FOODSTUFFS AND COSMETICS—CORRECTION OF NOTICE

The following correction of Government Notice 2572 of 15 November 1985 is hereby published:

Add the following Annexure to the regulations:

“ANNEXURE

Dosimetry

1. The overall average absorbed dose.

In determining the wholesomeness of foodstuffs treated with an overall average dose of 10 kGy or less, it may be assumed that all radiation chemical effects in that particular dose range are proportional to dose.

The overall average dose, D, is defined by the following integral over the total volume of the goods:

$$\bar{D} + \frac{1}{M} \int p(x, y, z) \cdot d(x, y, z) \cdot dV$$

where

M = the total mass of the treated sample

p = the local density at the point (x, y, z)

d = the local absorbed dose at the point (x, y, z)

dv = dx dy dz, the infinitesimal volume element which in real cases is represented by the volume fractions.

In die geval van homogene produkte en massagoedere van homogene massadigtheid kan die algemene gemiddelde geabsorbeerde dosis regstreeks bepaal word deur 'n voldoende getal dosimetryers op strategiese plekke en ewekansig deur die volume van die goedere heen te versprei. Van die dosisverspreiding op hierdie wyse bepaal, kan 'n gemiddelde bereken word wat die algemene gemiddelde geabsorbeerde dosis is.

Indien die kromme van die dosisverspreiding deur 'n monster van die produk heen 'n goedbepaalde vorm het, is die posisie van sowel die minimum as dié maksimum dosis bekend. Metings van die dosisverspreiding in hierdie twee posisies in 'n reeks sodanige monsters kan gebruik word om 'n beraming van die algemene gemiddelde dosis van die produk te maak.

In sommige gevalle sal die middelwaarde van die gemiddelde waardes van die minimum (\bar{D}_{\min}) en die maksimum (\bar{D}_{\max}) dosis 'n goeie beraming wees van die algemene gemiddelde dosis, dit is in hierdie gevalle

$$\text{algemene gemiddelde dosis} = \frac{\bar{D}_{\max} + \bar{D}_{\min}}{2}$$

2. Effektiewe en beperkende dosiswaardes.

Sekere doeltreffende behandelings, byvoorbeeld die vernietiging van skadelike mikroorganismes of 'n bepaalde rakleweverlenging of 'n disinfestasie, vereis 'n minimum geabsorbeerde dosis. In die geval van ander aanwendings kan 'n te hoog geabsorbeerde dosis onwenslike gevolge hê of die kwaliteit van die produk benadeel.

In die ontwerp van die fasilitet en die operasionele parameters moet die minimum en maksimum dosiswaardes wat deur die proses vereis word, in ag geneem word. By sommige lae dosisaanwendings sal dit moontlik wees om binne die bepalings van artikel 3 van *Goeie Bestralingsprosesseringspraktyk* 'n verhouding van maksimum tot minimum dosis van meer as 3 toe te laat.

Met inagneming van die maksimum dosiswaarde bestaanbaar met aanvaarbare heilsaamheid en as gevolg van die statistiese verspreiding van die dosis behoort 'n massafraksie van ten minste 97,5 % van die produk 'n geabsorbeerde dosis van minder as 15 kGy te ontvang wanneer die algemene gemiddelde dosis 10 kGy is.

3. Roetinedosimetrie.

Metings van die dosis in 'n verwysingsposisie kan af en toe tydens die proses gemaak word. Die verband tussen die dosis in die verwysingsposisie en die algemene gemiddelde dosis moet bekend wees. Hierdie metings moet gebruik word om die korrekte werking van die proses te verseker. 'n Erkende en gekalibreerde dosimetriesysteem moet gebruik word.

Volledige aantekeninge van alle dosimetries insluitende kalibrasie moet gehou word.

4. Proseskontrole.

In die geval van 'n ononderbroke radionukliedfasilitet sal dit moontlik wees om otomaties aantekening te hou van die deurgangspoed of stilstandtyd en van die bron en produkposisieering. Hierdie metings kan gebruik word om deurlopende kontrole oor die proses te verskaf ter ondersteuning van die roetinedosimetries.

In 'n radionukliedfasilitet wat op 'n lotgrondslag bedryf word, kan die bronblootstellingstyd otomaties geregistreer word en aantekening van produkbeweging en -plasing kan gehou word om kontrole te verskaf oor die proses ter ondersteuning van die roetinedosimetries.

In 'n masjiensfasilitet kan deurlopende aantekeninge van die straalbundelparameters, dit is spanning, stroom, aftasspoed, aftaswydte en puls-herhaling, en 'n aantekening van die deurgangspoed deur die straalbundel gebruik word om deurlopende kontrole oor die proses te verskaf ter ondersteuning van die roetinedosimetries.

REGULASIES BETREFFENDE VOEDSELKLEUR-STOWWE.—VERBETERINGSKENNISGEWING

Onderstaande verbeterings aan Goewermentskennisgewing R. 2152 van 27 September 1985 word hierby vir algemene inligting gepubliseer:

- (a) Skrap in regulasie 2 die syfer "75" in kolom III in beide die Afrikaanse en die Engelse teks; en
- (b) voeg in regulasie 2 in die korrekte alfabetiese posisie onder die item "Vrugte" in kolom 1 die volgende subitem en die daarteenoorvraagende kleurindeksnommer, naam van kleursof en voorwaardes en perke in:

I Voedingsmiddel	II Kleurindeks-nommer	III Naam van kleurstof Voorwaardes en perke (mg/kg)
"Kersies in stroop verpak, heel of halwe, met pite of ontpit"	45430	Eritrosien BS GVP"

In the case of homogeneous products and bulk goods of homogeneous bulk density, the overall average absorbed dose can be determined directly by distributing an adequate number of dosimeters strategically and at random throughout the volume of the goods. From the dose distribution determined in this manner an average can be calculated which is the overall average absorbed dose.

If the curve of the dose distribution throughout a sample of the product has a well-determined shape, the position of both the minimum and the maximum dose is known. Measurements of the dose distribution in these two positions in a series of such samples can be used to estimate the overall average dose of the product. In some cases the mean value of the average values of the minimum (\bar{D}_{\min}) and maximum (\bar{D}_{\max}) dose will be a good estimate of the overall average dose, i.e. in these cases

$$\text{overall average dose} = \frac{\bar{D}_{\max} + \bar{D}_{\min}}{2}$$

2. Effective and limiting dose values.

Some effective treatments, e.g. the elimination of harmful micro-organisms, a particular shelf-life extension or a disinfestation, require a minimum absorbed dose. In the case of other applications too high an absorbed dose may have undesirable effects or impair the quality of the product.

The design of the facility and the operational parameters have to take into account the minimum and maximum dose values required by the process. In some low-dose applications it will be possible within the terms of section 3 of *Good Radiation Processing Practice* to allow a ratio of maximum to minimum dose of greater than 3.

Regard being had to the maximum dose value consistent with acceptable wholesomeness and because of the statistical distribution of the dose, a mass fraction of product of at least 97,5 % should receive an absorbed dose of less than 15 kGy when the overall average dose is 10 kGy.

3. Routine dosimetry.

Measurements of the dose in reference position can be made occasionally throughout the process. The association between the dose in the reference position and the overall average dose must be known. These measurements should be used to ensure the correct operation of the process. Use must be made of a recognised and calibrated system of dosimetry.

A complete record is to be kept of all dosimetry measurements, including calibration.

4. Process control.

In the case of a continuous radionuclide facility it will be possible to make automatically a record of the transportation speed or dwell time and of the source and product positioning. These measurements can be used to provide a continuous control of the process in support of the routine dosimetry measurements.

In a batch operated radionuclide facility, the source exposure time can be recorded automatically and a record of product movement and placement can be kept to provide a control of the process in support of the routine dosimetry measurements.

In a machine facility a continuous record of the beam parameters, i.e. voltage, current, scan speed, scan width and pulse repetition, and a record of the transportation speed through the beam can be used to provide a continuous control of the process in support of the routine dosimetry measurements.
