Subsection	Item	Operative date	Exclusions	Exclusion expiry date
All subsections/items not referred to below		1 January 1997		
3.1.4	Marking – speed-category	1 January 1997	Diagonal (bias-ply) tyres	1 July 1998

1 Scope

This compulsory specification is based on ECE Regulation No. 54 of 13 June 1983 "Uniform provisions concerning the approval of pneumatic tyres for commercial vehicles and their trailers" incorporating:

Amendment 1 14 March 1988

Corrigendum 1 16 May 1988

Amendment 2 3 August 1989

Amendment 3 18 June 1993

It covers new pneumatic tyres primarily designed for use by all road vehicles. It does not, however, apply to:

1.1 New tyres for private (passenger) cars and their trailers.

1.2 Tyres of a speed category below 80 km/h; or

1.3 Tyres designed for cycles and motor cycles; or

1.4 Tyres of a speed category above 150 km/h.

1.5 For ease of cross-reference the numbering system employed in the ECE Regulation has been retained. Those paragraphs not applicable to South Africa have been deleted and certain paragraph numbers have been set aside for future use. All such paragraphs are designated "Reserved" in this specification.

Certain paragraphs have been amended to suit South African conditions. These are 2.27, 3.1, 3.1.8, 3.1.10, 3.4, 6.2.4 and 6.2.5. The word "Regulation" has been replaced with the word "specification" throughout the text.

2 Definitions

2.1 "Type of pneumatic tyre" means a category of pneumatic tyres which do not differ in such essential respects as:

2.1.1 Manufacturer's name or trade mark;

2.1.2 Tyre-size designation;

2.1.3 Category of use (normal: normal-road-use tyres; special: special-use tyres, e.g. snow tyres, tyres for mixed use (both on and off the road) or at restricted speed, or both);

2.1.4 Structure (diagonal (bias-ply); radial);

2.1.5 Speed category;

2.1.6 Load-capacity indices; and

2.1.7 Cross-section;

2.2 "Snow tyre" means a tyre whose tread pattern and whose structure are primarily designed to ensure in mud and fresh or melting snow a performance better than that of an ordinary (road-type) tyre. The tread pattern of a snow tyre generally consists of groove (rib) or solid block elements (or both) more widely spaced than on an ordinary (road-type) tyre;

2.3 "Structure" of a pneumatic tyre means the technical characteristics of the tyre's carcass. A distinction is made between the following structures in particular:

2.3.1 "Diagonal" or **"bias-ply"** describes a pneumatic-tyre structure in which the ply cords extend to the beads and are laid at alternate angles substantially less than 90° to the centreline of the tread;

2.3.2 "Radial" describes a pneumatic-tyre structure in which the ply cords extend to the beads and are laid substantially at 90° to the centreline of the tread, the carcass being stabilized by an essentially inextensible circumferential belt;

2.4 "Bead" means the part of a pneumatic tyre which is of such shape and structure as to fit the rim and to hold the tyre on it¹⁾;

2.5 "Cord" means the strands forming the fabric of the plies in the pneumatic tyre¹⁾;

2.6 "Ply" means a layer of rubber-coated parallel cords¹⁾;

2.7 "Carcass" means that part of a pneumatic tyre other than the tread and the rubber sidewalls which, when inflated, bears the load¹⁾;

2.8 "Tread" means that part of a pneumatic tyre which comes into contact with the ground, protects the carcass against mechanical damage and contributes to ground adhesion¹⁾;

2.9 "Sidewall" means the part of a pneumatic tyre between the tread and the area designed to be covered by the rim flange¹⁾;

1) See explanatory figure.

3.1.4.2 An indication of a second speed category in cases where paragraph 6.2.5 below is applied;

3.1.5 The inscription M+S or M.S or M&S in the case of a snow tyre;

3.1.6 The load-capacity indices as defined in paragraph 2.27 of this specification;

3.1.7 The word "TUBELESS" if the tyre is designed for use without an inner tube;

3.1.8 The date of manufacture in the form of a group of three numerals, the first two showing the week and the third the year of manufacture. It is permissible to restrict this marking to one sidewall.

3.1.9 In the case of tyres which can be regrooved, the symbol "Ⓐ" at least 20 mm in diameter, or the word "REGROOVABLE", moulded into or on to each sidewall.

3.1.10 An indication, by the pressure index, of the inflation pressure to be adopted for the load/speed endurance tests, as explained in annex 7, appendix 2. It is permissible to restrict this indication to one sidewall.

3.2 Reserved

3.3 Annex 3 to this specification gives an example of an arrangement of the tyre markings.

3.4 The markings referred to in paragraph 3.1 shall be moulded on to or into the tyres. They shall be clearly legible and shall, except for the marking referred to in paragraph 3.1.1 above, be located on at least one lower sidewall.

4 Reserved

5 Reserved

6 Specifications

6.1 Dimensions of tyres

6.1.1 Section width of a tyre

6.1.1.1 The section width shall be obtained by means of the following formula:

$$S = S_1 + K(A - A_1)$$

where:

S is the "section width" expressed in millimetres and measured on the measuring rim;

S_1 is the "nominal section width" in millimetres, as shown on the sidewall of the tyre in the tyre designation as prescribed;

A is the width of the measuring rim in millimetres, as shown by the manufacturer in the descriptive note; and

A_1 is the width of the theoretical rim in millimetres.

A_1 shall be taken to equal S_1 multiplied by the factor x as specified by the manufacturer, and K shall be taken to equal 0.4.

6.1.1.2 However, for the existing types of tyres whose designation is given in the first column of the

Q	160
R	170

2.29 "Table of load-capacity variation with speed" means:

The table in annex 8 showing as a function of the load-capacity indices and nominal-speed-category symbols the load variations which a pneumatic tyre can withstand when used at speeds different from that conforming to its nominal-speed-category symbol. The load variations do not apply in the case of the additional load capacity symbol and speed category obtained when the provisions of paragraph 6.2.5 are applied.

3 Markings

3.1 Pneumatic tyres shall display on both sidewalls in the case of symmetrical tyres and at least on the outer sidewall in the case of asymmetrical tyres:

3.1.1 The manufacturer's name or trade mark;

3.1.2 The tyre-size designation as defined in paragraph 2.17 of this specification;

3.1.3 An indication of the structure as follows:

3.1.3.1 On diagonal (bias-ply) tyres: no indication, or the letter "D";

3.1.3.2 On radial-ply tyres: the letter "R" placed in front of the rim-diameter marking and, optionally, the word "RADIAL";

3.1.4 The speed-category symbol (or symbols);

3.1.4.1 An indication of the tyre's nominal speed category in the form of the symbol prescribed in paragraph 2.28.2 above;

2) For consistency, the symbols and speeds shown in this table are the same as those for passenger cars (as in Regulation No. 30). They should not be taken to indicate the speeds at which commercial vehicles fitted with such tyres may be operated on the roads.

A type of pneumatic tyre can have either one or two sets of load capacity indices depending on whether or not the provisions of paragraph 6.2.5 are applied. The list of these indices and their corresponding loads is given in annex 4;

2.28 "Speed category" means:

2.28.1 The speeds, indicated by a symbol, at which the tyre can carry the load indicated by the associated load-capacity index;

1) See explanatory figure.

2.10 "Lower sidewall" means the area included between the line of maximum section width of the tyre and the area designed to be covered by the rim flange¹⁾;

2.17.1.2 The nominal aspect ratio, except in the case of certain types of tyre for which the size designation is shown in the first column of the tables in annex 5 to this specification;

2.17.1.3 A conventional number "d" (the "d" symbol) denoting the nominal diameter of the rim and corresponding to its diameter expressed either in codes (numbers below 100) or in millimetres (numbers above 100). Numbers corresponding to both types of measurement may be used together in the designation;

6.1.5.2 For other sizes, not listed in annex 5, 'H' and 'd' are as defined in paragraph 6.1.2.1.

6.1.5.3 Coefficients 'a' and 'b' are respectively:

6.1.5.3.1 Coefficient 'a' = 0.97.

6.1.5.3.2 Coefficient 'b'

	Radial	Diagonal
for normal use tyres	1.04	1.07
for special use tyres	1.06	1.09

6.2 Load/speed endurance test

6.2.1 Each type of pneumatic tyre shall undergo at least one load/speed endurance test carried out by the procedure described in annex 7 to this specification.

6.2.2 A tyre which, after undergoing the endurance test, does not exhibit any tread separation, ply separation, cord separation, chunking or broken cords shall be deemed to have passed the test.

6.2.3 The outer diameter of the tyre, measured six hours after the load/speed endurance test, must not differ by more than ± 3.5 per cent from the outer diameter as measured before the test.

6.2.4 Where application is made for the testing of a type of pneumatic tyre for the load/speed combinations given in the table in annex 8, the endurance test prescribed in paragraph 6.2.1 above need not be carried out for load and speed values other than the nominal values.

6.2.5 Where application is made for the testing of a type of pneumatic tyre which has a load/speed combination in addition to the one that is subject to the variation of load with speed given in the table in annex 8, the endurance test prescribed in paragraph 6.2.1 above shall also be carried out on a second tyre of the same type at the additional load/speed combination.

7 Equivalent requirements

The requirements of this specification may be deemed to have been met if a tyre meets the requirements of ECE Regulation No. 54, EEC Directive 92/93 or DOT MVSS 119 and (is) marked with the appropriate E, e, or DOT mark.

tables in annex 5 to this specification, the section width shall be deemed to be that given opposite the tyre designation in those tables.

6.1.2 Outer diameter of a tyre

6.1.2.1 The outer diameter of a tyre shall be obtained by means of the following formula:

$$D = d + 2H$$

where:

D is the outer diameter expressed in millimetres;

d is the conventional number defined in paragraph 2.17.1.3 above, expressed in millimetres;

S_1 is the nominal section width in millimetres; and

R_a is the nominal aspect ratio;

H is the nominal section height in millimetres and is equal to $S_1 \times 0.01 R_a$.

All as in the tyre designation shown on the sidewall of the tyre in conformity with the requirements of paragraph 3.4 above.

However, for the existing types of tyres whose designation is given in the first column of the tables in annex 5 to this specification, the outer diameter shall be deemed to be that given opposite the tyre designation in those tables.

6.1.3 Method of measuring pneumatic tyres

The dimensions of pneumatic tyres shall be measured by the procedure described in annex 6 to this specification.

6.1.4 Tyre section-width specifications

6.1.4.1 The overall width of a tyre may be less than the section width or widths determined pursuant to paragraph 6.1.1 above.

6.1.4.2 It may exceed that value by 4 per cent in case of radial-ply tyres and by 8 per cent in the case of diagonal (bias-ply) tyres. However, for tyres of a section width exceeding 305 mm intended for dual mounting (twinning), the nominal value shall not be exceeded by more than 2 per cent for radial-ply tyres or 4 per cent for diagonal (bias-ply) tyres.

6.1.5 Tyre outer diameter specification

The outer diameter of a tyre must not be outside the values D_{min} and D_{max} obtained from the following formulae:

$$D_{min} = d + (2H \times a)$$

$$D_{max} = d + (2H \times b)$$

where:

6.1.5.1 For sizes listed in annex 5

$$H = 0.5 (D - d) - \text{for references see paragraph 6.1.2.1.}$$

The positioning and order of the markings constituting the tyre designation shall be the following:

- a) the size designation, comprising the nominal section width, the nominal aspect ratio, the type-of-structure symbol (where applicable) and the nominal rim diameter, shall be grouped as shown in the above example: 250/70 R 20;
- b) the load indices and the symbol of the speed category shall be placed together near the size designation. They may either precede or follow it or be placed above or below it;
- c) the symbol "TUBELESS" may be at a distance from the size-designation symbol;
- d) if paragraph 6.2.5 of this specification is applied, the additional load-capacity indices and speed category symbol must be shown inside a circle near the nominal load-capacity indices and speed category symbol appearing on the tyre sidewall.

Annex 6

Method of measuring pneumatic tyres

- 1 The tyre is mounted on the measuring rim specified by the manufacturer and is inflated to a pressure specified by the manufacturer.
- 2 The tyre fitted on its rim is conditioned to the ambient temperature of the laboratory for at least 24 hours.
- 3 The pressure is readjusted to the value specified in paragraph 1 above.
- 4 The overall width is measured by calliper at six equally-spaced points, account being taken of the thickness of the protective ribs or bands. The highest measurement so obtained is taken as the overall width.
- 5 The outer diameter is calculated from the maximum circumference.

Annex 7

Procedure for load/speed endurance tests

1 Preparing the tyre

- 1.1 Mount a new tyre on the test rim specified by the manufacturer.
- 1.2 Use a new inner tube or combination of inner tube, valve and flap (as required) when testing tyres with inner tubes.
- 1.3 Inflate the tyre to the pressure corresponding to the pressure index specified by the manufacturer.
- 1.4 Condition the tyre-and-wheel assembly at test-room temperature for not less than three hours.
- 1.5 Readjust the tyre pressure to that specified in paragraph 1.3 above.

2 Test procedure

- 2.1 Mount the tyre-and-wheel assembly on the test axle and press it against the outer face of a smooth power-driven test drum $1,70\text{ m} \pm 1$ per cent in diameter having a surface at least as wide as the tyre tread.
- 2.2 Apply to the test axle a series of test loads expressed in per cent of the load indicated, in annex 4 to this specification, opposite the load index engraved on the sidewall of the tyre, in accordance with the test programme below. Where the tyre has load-capacity indices for both single and twinned utilization, the reference load for single utilization shall be taken as the basis for the test loads.

ENDURANCE-TEST PROGRAMME (see appendix 1 to this annex)

- 2.3 The tire pressure must not be corrected throughout the test and the test load must be kept constant throughout each of the three test stages.
- 2.4 During the test the temperature in the test room must be maintained at between 20°C and 30°C or at a higher temperature if the manufacturer so agrees.
- 2.5 The endurance-test programme shall be carried out without interruption.

3 Equivalent test methods

If a method other than that described in paragraph 2 above is used, its equivalence must be demonstrated.

NOTES

1 "Special-use" tyres (see paragraph 2.1.3 of the specification) should be tested at a speed equal to 85 per cent of the speed prescribed for equivalent normal tyres.

2 Tyres with a load index of 122 or more of speed categories above M are not yet produced.

Die betreklike spesifikasie word sedert 1 September 1997 as verpligte spesifikasie van die Suid-Afrikaanse Buro vir Standaarde bygevoeg. Die gevreesde datums van hierdie spesifikasie kan verleng word tot 31 Desember 1997. Daarvan uitgaandes moet die spesifikasie in Suid-Afrika vanaf 1 April 1998 volgens die spesifieke norme tot bediening gebring word. Die spesifikasie word gevreesd dat dit die voorbereidende begin van 'n groter geslagsverandering in die gebruik van lugbande in Suid-Afrika sal markeer. Die vervaardiging van lugbande volgens die ou spesifikasie word daarvan uitgaandes toegelaat tot die voorbereiding van die gebruik van lugbande volgens die nuwe spesifikasie voltooi is.

6 Spesifikasies

6.1 Afmetings van bande

6.1.1 Deursneebreedte van 'n band

6.1.1.1 Die deursneebreedte moet aan die hand van die volgende formule bereken word:

$$S = S_1 + K(A_1 - A_2)$$

waar: S die "deursneebreedte", gemeet op die meetvelling is, in millimeter; S_1 die "nominale deursneebreedte" soos in die voorgeskrewe bandaanwysing op die sywand van die band aangedui is, in millimeter:

- A die breedte is van die meetvelling, soos deur die fabrikant in die beskrywing aangegee is, in millimeter; en
- A₁ die breedte van die teoretiese velling is, in millimeter.
- A₁ moet geneem word as gelyk aan S_1 , vermenigvuldig met die faktor x , soos deur die fabrikant gespesifiseer, en K moet geneem word as gelyk aan 0,4.

6.1.1.2 In die geval van bestaande bandtipes waarvoor die aanwysing in die eerste kolom van die tabelle in aanhangsel 5 van hierdie spesifikasie aangegee word, moet die deursneebreedte egter beskou word as dié teenoor die bandaanwysing in die tabelle.

6.1.2 Buitediameter van 'n band

6.1.2.1 Die buitediameter van 'n band moet aan die hand van die volgende formule bereken word:

$$D = d + 2H$$

waar:

- D die buitediameter is, in millimeter;
- d die konvensionele getal is, wat in paragraaf 2.17.1.3 hierbo omskryf is, in millimeter;
- S_1 die nominale deursneebreedte is, in millimeter;
- R_a die nominale raamformaat is; en
- H die nominale deursneehoogte is, in millimeter, en gelyk is aan $S_1 \times 0,01 R_a$.

In alle gevalle volgens die vereistes van paragraaf 3.4 hierbo is die bandaanwysing op die sywand van die band aangedui.

6.1.2.2 In die geval van die bestaande bandtipes waarvoor die aanwysings in die eerste kolom van die tabelle in aanhangsel 5 van hierdie spesifikasie aangegee word, moet die buitediameter beskou word as dié wat teenoor die bandaanwysing in die tabelle aangegee word.

6.1.3 Metode vir die meet van lugbande

Die afmetings van lugbande moet volgens die prosedure wat in aanhangsel 6 van hierdie spesifikasie beskryf word, gemeet word.

6.1.4 Spesifikasies vir banddeursneebreedte

6.1.4.1 Die totale breedte van 'n band kan minder wees as die deursneebreedte of -breedtes wat volgens paragraaf 6.1.1 hierbo bepaal is.

6.1.4.2 Dit kan sodanige waarde met 4 persent oorskry in die geval van straalaaagbande en met 8 persent in die geval van kruislaag(skuinslaag)-bande. In die geval van bande waarvan die deursnee breedte egter meer as 305 mm is en wat vir dubbelmontering bedoel is, mag die nominale waarde nie met meer as 2 persent in die geval van straalaaagbande of 4 persent in die geval van kruislaag(skuinslaag)-bande oorskry word nie.

6.1.5 Spesifikasie vir bandbuitediameter

Die buitediameter van 'n band moet minstens D_{min} en hoogstens D_{maks} wees. D_{min} en D_{maks} moet aan die hand van die volgende formules bereken word:

$$D_{min} = d + (2H \times a)$$

$$D_{maks} = d + (2H \times b)$$

waar:

6.1.5.1 In die geval van groottes in die lys in aanhangsel 5

$$H = 0.5 (D-d) - \text{kyk paragraaf 6.1.2.1 vir verwysings.}$$

6.1.5.2 In die geval van ander groottes wat nie in die lys in aanhangsel 5 aangegee word nie is 'H' en 'd' soos in paragraaf 6.1.2.1 omskryf word.

6.1.5.3 Koëffisiënt 'a' en 'b' is onderskeidelik:

6.1.5.3.1 Koëffisiënt 'a' = 0.97.

6.1.5.3.2 Koëffisiënt 'b'

	Straallaag	Kruislaag
in die geval van bande vir normale gebruik	1.04	1.07
in die geval van bande vir spesiale gebruik	1.06	1.09

6.2 Las/spoed-uithoutoets

6.2.1 Elke tipe lugband moet onderwerp word aan minstens een las/spoed-uitoutoets wat uitgevoer word volgens die prosedure wat in aanhangsel 7 van hierdie spesifikasie beskryf word.

6.2.2 Daar word geag dat 'n band wat, nadat dit aan die uithoutoets onderwerp is, geen loopvlakskeiding, laagskeiding, koordskeiding, afbrokkeling of stukkende koorde toon nie, in die toets geslaag het.

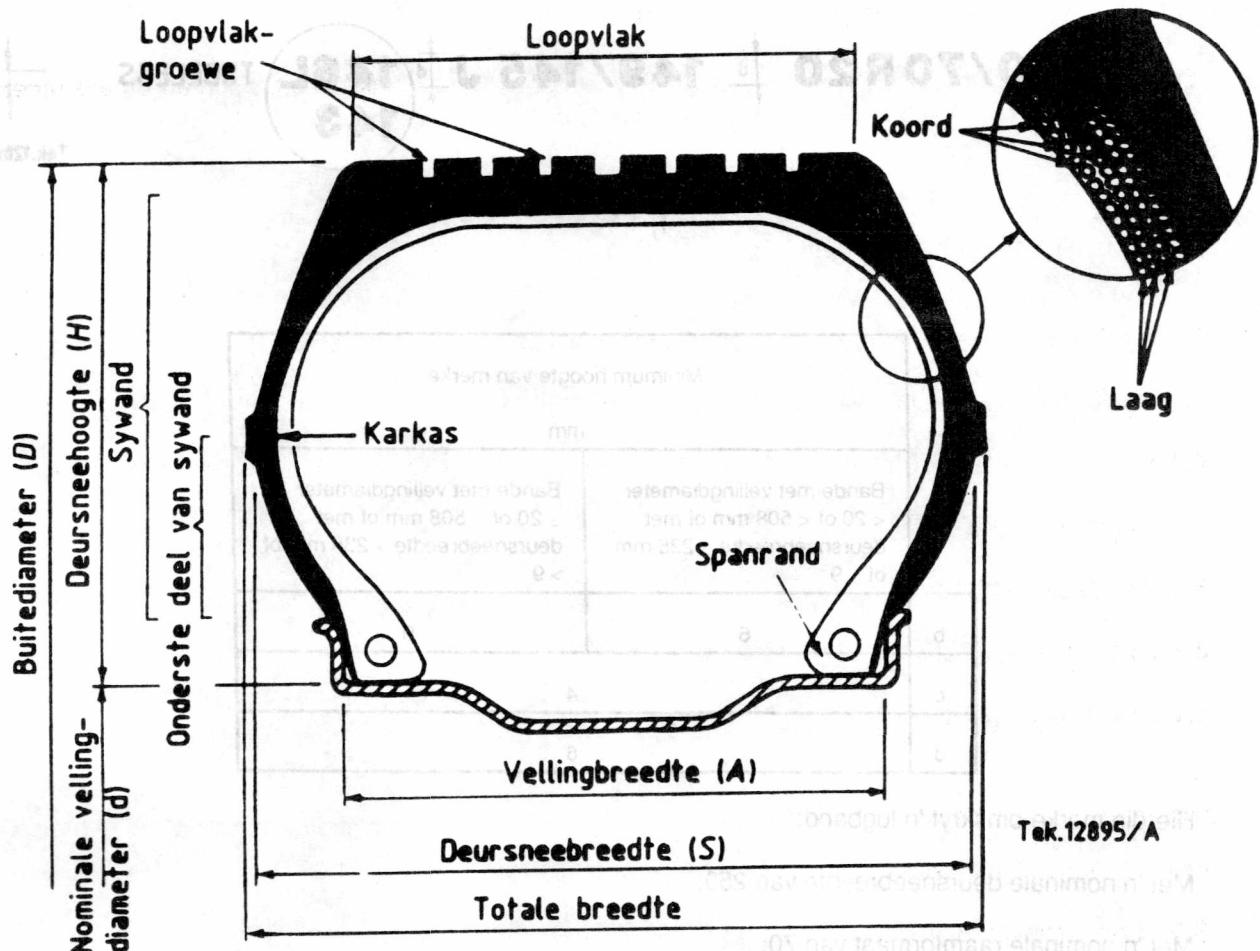

6.2.3 Die buitediameter van die band, ses uur na die las/spoed-uitoutoets gemeet, mag nie met meer as ± 3.5 persent verskil van die buitediameter wat voor die toets gemeet is nie.

6.2.4 Indien aansoek gedoen word om die toets van 'n tipe lugband vir die las/spoed-kombinasies in die tabel in aanhangsel 8, hoef die voorgeskrewe uithoutoets in paragraaf 6.2.1 hierbo nie tov ander las-spoedwaardes as die nominale waardes uitgevoer te word nie.

6.2.5 Indien aansoek gedoen word om die toets van 'n tipe lugband met 'n las/spoed-kombinasie bykomend tot dié wat aan die laswisseling volgens spoed soos aangegee in die tabel in aanhangsel 8 onderworpe is, moet die uithoutoets in paragraaf 6.2.1 hierbo voorgeskryf ook op 'n tweede band van dieselfde tipe by die bykomende las/spoed-kombinasie uitgevoer word.

Die volgende spesifikasie van 'n karkas vir 'n loopvlakgroewe is uitgestuur deur die minister van landbou, voedsel en tuinebou. Die spesifikasie moet aan alle loopvlakgroewe wat vervaardig word, toegepas word.

Metode vir die meet van lugbande

- 1 Die band word gemonteer op die meetvelling wat die fabrikant spesifieer en word opgepomp tot 'n druk wat die fabrikant spesifieer.
- 2 Die band wat op die velling aangebring is, word minstens 24 uur lank by die omgewingstemperatuur van die laboratorium gekondisioneer.
- 3 Die druk word verstel tot die waarde wat in paragraaf 1 hierbo gespesifieer word.
- 4 Die totale breedte word met behulp van 'n meetpasser op ses eweredig verspreide plekke gemaat, met inagneming van die dikte van die beskermende ribbe of stroke. Die grootste afmeting wat so verkry word, word as die totale breedte beskou.
- 5 Die buitediameter word aan die hand van die maksimum omtrek bereken.

Aanhangsel 7

Prosedure vir las/spoed-uithoutoetse

1 Voorbereiding van die band

- 1.1 Monteer 'n nuwe band op die toetsvelling wat die fabrikant spesifiseer.
- 1.2 Gebruik 'n nuwe binneband of 'n kombinasie van binneband, klep en klap (soos vereis) wanneer bande met binnebande getoets word.
- 1.3 Pomp die band op tot die banddruk wat ooreenstem met die banddrukindeks wat die fabrikant spesifiseer.
- 1.4 Kondisioneer die band-en-wiel-samestel minstens drie uur lank by toetskamertemperatuur.
- 1.5 Verstel die banddruk tot die druk wat in paragraaf 1.3 hierbo gespesifiseer word.

2 Toetsprosedure

- 2.1 Monteer die band-en-wiel-samestel op die toetsas en druk dit teen die buitevlak van 'n gladde kraggedrewe toetstrommel met 'n diameter van $1.70\text{ m} \pm 1\text{ persent}$ en met 'n oppervlak wat minstens so breed soos die bandloopvlak is.
- 2.2 Lé 'n reeks toetslaste, uitgedruk as 'n persentasie van die las wat in aanhangsel 4 van hierdie spesifikasie aangegee word teenoor die lasindeks wat op die sywand van die band gegraveer is, in ooreenstemming met die toetsprogram hieronder op die toetsas op. In gevalle waar die band lasvermoë-indekse vir enkelgebruik sowel as dubbelgebruik het, moet die verwysingslas vir enkelgebruik as die grondslag vir die toetslaste geneem word.

UITHOUTOETSPROGRAM (kyk bylae 1 by hierdie aanhangsel)

- 2.3 Die banddruk mag nie tydens die toets verstel word nie en die toetslas moet deurgaans tydens elk van die drie toetsfases konstant gehou word.
- 2.4 Tydens die toets moet die temperatuur in die toetskamer by tussen 20°C en 30°C gehou word, of hoër indien die fabrikant instem.
- 2.5 Die uithoutoetsprogram moet sonder onderbreking uitgevoer word.

3 Ekwivalente toetsmetodes

Indien 'n ander metode as dié in paragraaf 2 hierbo gevvolg word, moet die ekwivalensie daarvan bewys word.

OPMERKINGS

- 1 Bande vir "spesiale gebruik" (kyk paragraaf 2.1.3 van die spesifikasie) moet getoets word teen 'n spoed wat gelyk is aan 85 persent van die spoed wat vir soortgelyke normale bande voorgeskryf word.
- 2 Bande met 'n lasindeks van 122 of hoer van spoedkatgorieë bo M word nog nie vervaardig nie.
